Calup: Cashfree Readiness Action Plan

Prepared 19 October 2026, based on the ChatGPT audit of calup-in.vercel.app

Summary

The audit is mostly right. Some findings can be fixed today; others can't be verified until the code is audited. Do the quick public-page fixes first, then run the code audit, then reply to Cashfree.

Forks don't auto-update, so the college deployment and the Vercel deployment are two separate copies. Pick one source of truth and point calup.app at it.

1. Connect calup.app to a deployment you control

Option A: point calup.app at Vercel (fastest, about 10 minutes)

1. Vercel project, Settings, Domains: add `calup.app`.
2. Add the DNS records Vercel shows you at name.com.
3. Add `https://calup.app` to the allowed CORS origins on the Render backend.
4. Add `https://calup.app` to the redirect URIs in the Google OAuth client and the Supabase Auth URL settings.

Catch: your college contact asked you to take the app off Vercel and Render. If you want to keep the college hosting, use Option B.

Option B: keep the college server

- Sync the fork (GitHub Sync fork button) or run:
  - `git remote add upstream https://github.com/prateekthota18-boop/bookup.in.git`
  - `git fetch upstream`
  - `git merge upstream/main`
  - `git push origin main`
- They must then pull, rebuild and restart on the server. Ask for auto-deploy (a GitHub Action or webhook).
- New env vars added since the fork must be added on their server.

- New Supabase migrations must be run on the DB that server uses.

Security

The repo is public and the `.env` was handed over. Confirm no secrets are in the repo history. If the `.env` held the Supabase service key, Google client secret, Resend key or token-encryption key, rotate them after the handover settles.

2. Cashfree submission: use calup.app, not the vercel.app link

Payment gateways usually want a live site on your own domain showing business details, a clear service description and the legal pages. A `*.vercel.app` URL often looks like a test site. Confirm the exact requirements in the written reply you are waiting on from Cashfree.

Before sending, check that:

- The site looks live, with no demo data or broken pages.
- A reviewer can see where payment happens.
- Every footer page loads and states your business name, address and refund rules consistently.

3. Do this week, before submitting (all small)

1. **Operator identity.** Put your legal name or "CALUP (proprietorship)", Hyderabad address, phone and email on `/contact` and `/terms-and-conditions`. They must match your Udyam certificate exactly.
2. **Grievance contact.** Replace "Pending appointment" with yourself as grievance contact, with your email.
3. **Remove the draft banner** on the policy pages once 1 and 2 are done.
4. **Free vs paid.** Pick one sentence and use it everywhere, for example: "Free during early access. From [date], Rs 299 per 30 days plus tax." If undecided, say "free during early access" and remove the Rs 299 page until decided.
5. **Payment wording.** Describe only what works today: UPI payment with coach confirmation, plus Cashfree in sandbox. Remove "automatic" and "coming soon card payments" claims you can't back up.
6. **One domain.** Use calup.app everywhere: footer, support email, links and the Cashfree application.

7. **Button text.** Change "Confirm Booking" to "Continue to payment".

4. Next: code audit (in Antigravity)

ChatGPT could not read the repo (GitHub returned 404), so run the same audit where the code is available. Check whether the repo was renamed or made private after the rebrand. Verify the P0 items:

- RLS, grants and public functions
- Atomic slot holds, expiry and late-payment handling
- Idempotent payment confirmation
- Secrets staying server-side
- Private storage for payment screenshots
- Tracking lookup not leaking data or allowing cancel/reschedule without verification

Most RLS and booking-function items were already fixed earlier, so this is a verification pass, not new work.

5. Do not do yet

- Full desktop booking layout, UI library migration, signup step naming. Nice, but won't affect Cashfree approval.
- Refund, vendor split and reconciliation machinery. Build it once Cashfree approves Easy Split for your model; their written reply decides the design.
- A fake "simulate success" button. If you add a sandbox flow, route it through real Cashfree sandbox order creation, or skip it.

6. Policy text must match the policy engine

The booking page shows 24h/2h refund bands and a 24h reschedule notice, while the global cancellation policy mentions a 15-minute threshold and a 3-day reschedule limit. Don't change the rules. Make the public wording match what `policyEngine` actually does, and show a compact summary generated from the same policy snapshot.

7. Payment integration shape (for when Easy Split is approved)

Stage	Required behaviour
Acquire booking hold	Backend validates service, coach and availability, computes price, snapshots the accepted policy, atomically acquires the slot.
Create Cashfree order	Backend creates the INR order with a persisted booking/order mapping and an idempotency key. Secrets stay on the backend.
Attach vendor allocation	Resolve the coach's approved vendor ID server-side. Never trust a vendor or split from the browser.
Open checkout	Return `payment_session_id` to the frontend and open Cashfree hosted checkout.
Receive webhook	Verify the signature over the original raw body, using the timestamp and signature headers.
Verify and update	Validate order, payment, amount and currency, then record the payment and confirm the booking in one transaction.
Return and reconcile	The return page reads backend status; a reconciliation job recovers missed or delayed notifications.

A browser redirect alone is never proof of payment.

8. Execution order

1. Finalise operator identity, address, support channels and grievance disclosure.
2. Align pricing, payment capability and delivery wording on every public page.
3. Reconcile customer policy text with the `policyEngine` defaults and booking snapshots.
4. Deploy to calup.app (Option A or B).
5. Run the code audit in Antigravity and fix only real findings.
6. Reply to Cashfree with calup.app and the updated pages.

7. After Cashfree's written reply on Easy Split: build sandbox order, webhook, idempotent confirmation, refunds and settlement tracking.
8. Run end-to-end desktop and mobile sandbox tests, including duplicate events, network loss and coach cancellation, then submit for production review.
